

VANHEARRON GROUT ONCE!

SELF SEALING ADMIX FOR CEMENT BASED GROUTS

Grout Once is an admix for cement based grouts that seals the grout by filling the capillaries in the grout as it cures. As the grout cures the Grout Once seeks out the free alkali and reacts with it to essentially fill the voids in the body of the grout. One noticeable trait of Grout Once is that it does not generally exhibit the “water beading” effect that is common with most topical sealers. This trait is intentional, while the grout is sealed all the way through Grout Once is designed to leave an open cross link micro layer on top that allows the consumer to change the color or enhance the grout in the future without having to use harsh chemicals to dissolve the surface layer. As a for instance : if you were to place a dollop of water the size of a 50 cent piece on the surface of the grout, while the surface of the grout will darken, the water will sit on top of the grout until it evaporates. So when the question arises “how is it sealed?” the answer is it is sealed in the interior structure and any water or contaminants cannot penetrate past the micro layer. The micro layer is easily cleanable and therefore leaves the grout exceptionally stain resistant.
